

Analyzing of Data-Call Utilization on Medication Reminder App for A Comparative Study Between iOS and Android Applications.

INTRODUCTION

- Medication-Reminder applications that remind you to take your medication on time can be helpful. Physicians have the ability to time the creation of personalized medications, and patients can easily get prescription drugs and monitor their success.
- The aim of this project is to assess and contrast the Data consumption and user navigation durations experienced during the prescribing drugs on both the Medication-Reminder Android application and the iOS platform.
- Medication-Reminder lets you experience the medical rehabilitation of the future. Our technology gives doctors the ability to create accurate recovery plan.
- It gives patients access to recommended medications and progress tracking for the best possible healing with little data usage.
- In evaluating the Medication-Reminder iOS and Android applications, with an emphasis on medicine protocols, we found that the iOS used less data for navigation than the Android application.

MATERIALS AND METHODS

RESULTS

Fig 2: Comparision of Andriod and iOS Application in terms of Data Utilization.

Group Statistics					
	Algorith m	N	Mean	Std. Deviation	Std. Error Mean
Response time	Android	10	30.1000	5.80134	1.83455
	iOS	10	31.1000	7.29459	2.30675

- Comparision of Andriod and iOS Application in terms of Data Utilization. The Mean Recovery Rate of iOS is significantly higher than Android in Medication-Reminder.
- While both versions serve the same purpose of reminding users about their medication schedule, differences in data utilization.
- It can impact various factors such as battery consumption, network usage, and overall device performance.

DISCUSSION AND CONCLUSION

- Based on T-test Statistical analysis, the significance value of $p=0.005$ (independent sample T - test $p<0.05$) is obtained and shows that there is a statistical significant difference between the group 1 and group 2.
- Overall, the Response time of the Medication-Reminder iOS Application is 32.92ms and it is better than the Android Application. The Medication-Reminder Android Application is 30.00ms.
- From the work, it is concluded that the iOS Application Android Application in Data utilization in Medication-Reminder.
- The observed difference in response time suggests potential areas for improvement in the Android application's performance, particularly in optimizing code execution, network communication, or other factors contributing to response time.
- The importance of data utilization is data privacy and management, particularly in healthcare Applications, prioritizing data-efficient practices can enhance user trust.
